## Section A: Pure Mathematics

**1** (i) Find the real values of *x* for which

$$x^3 - 4x^2 - x + 4 \ge 0.$$

(ii) Find the three lines in the (x, y) plane on which

$$x^3 - 4x^2y - xy^2 + 4y^3 = 0.$$

(iii) On a sketch shade the regions of the (x, y) plane for which

$$x^{3} - 4x^{2}y - xy^{2} + 4y^{3} \ge 0.$$

2 (i) Suppose that

$$S = \int \frac{\cos x}{\cos x + \sin x} dx$$
 and  $T = \int \frac{\sin x}{\cos x + \sin x} dx$ .

By considering S + T and S - T determine S and T.

(ii) Evaluate 
$$\int_{\frac{1}{4}}^{\frac{1}{2}} (1-4x) \sqrt{\frac{1}{x}-1} \, \mathrm{d}x$$
 by using the substitution  $x = \sin^2 t$ .

3 (i) If f(r) is a function defined for r = 0, 1, 2, 3, ..., show that

$$\sum_{r=1}^{n} \{ f(r) - f(r-1) \} = f(n) - f(0).$$

(ii) If 
$$f(r) = r^2(r+1)^2$$
, evaluate  $f(r) - f(r-1)$  and hence determine  $\sum_{r=1}^n r^3$ .

(iii) Find the sum of the series  $1^3 - 2^3 + 3^3 - 4^3 + \dots + (2n+1)^3$ .

**4** By applying de Moivre's theorem to  $\cos 5\theta + i \sin 5\theta$ , expanding the result using the binomial theorem, and then equating imaginary parts, show that

$$\sin 5\theta = \sin \theta \left( 16 \cos^4 \theta - 12 \cos^2 \theta + 1 \right).$$

Use this identity to evaluate  $\cos^2 \frac{1}{5}\pi$ , and deduce that  $\cos \frac{1}{5}\pi = \frac{1}{4}(1+\sqrt{5})$ .

5

lf

$$f(x) = nx - {\binom{n}{2}}\frac{x^2}{2} + {\binom{n}{3}}\frac{x^3}{3} - \dots + (-1)^{r+1}{\binom{n}{r}}\frac{x^r}{r} + \dots + (-1)^{n+1}\frac{x^n}{n},$$

show that

$$f'(x) = \frac{1 - (1 - x)^n}{x}.$$

Deduce that

$$f(x) = \int_{1-x}^{1} \frac{1-y^n}{1-y} dy.$$

Hence show that

$$f(1) = 1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n}$$

6 (i) In the differential equation

$$\frac{1}{y^2}\frac{\mathrm{d}y}{\mathrm{d}x} + \frac{1}{y} = \mathrm{e}^{2x}$$

make the substitution u = 1/y, and hence show that the general solution of the original equation is

$$y = \frac{1}{A\mathrm{e}^x - \mathrm{e}^{2x}} \,.$$

(ii) Use a similar method to solve the equation

$$\frac{1}{y^3}\frac{\mathrm{d}y}{\mathrm{d}x} + \frac{1}{y^2} = \mathrm{e}^{2x}.$$

Paper I, 1995 May 25, 2016

- 7 Let A, B, C be three non-collinear points in the plane. Explain briefly why it is possible to choose an origin equidistant from the three points. Let O be such an origin, let G be the centroid of the triangle ABC, let Q be a point such that  $\overrightarrow{GQ} = 2\overrightarrow{OG}$ , and let N be the midpoint of OQ.
  - (i) Show that  $\overrightarrow{AQ}$  is perpendicular to  $\overrightarrow{BC}$  and deduce that the three altitudes of  $\triangle ABC$  are concurrent.
  - (ii) Show that the midpoints of AQ, BQ and CQ, and the midpoints of the sides of  $\triangle ABC$  are all equidistant from N.

[The *centroid* of  $\triangle ABC$  is the point G such that  $\overrightarrow{OG} = \frac{1}{3}(\overrightarrow{OA} + \overrightarrow{OB} + \overrightarrow{OC})$ . The *altitudes* of the triangle are the lines through the vertices perpendicular to the opposite sides.]

8 Find functions  ${\rm f},{\rm g}$  and  ${\rm h}$  such that

$$\frac{\mathrm{d}^2 y}{\mathrm{d}x^2} + f(x)\frac{\mathrm{d}y}{\mathrm{d}x} + g(x)y = h(x) \tag{*}$$

is satisfied by all three of the solutions y = x, y = 1 and  $y = x^{-1}$  for 0 < x < 1.

If  ${\rm f},{\rm g}$  and  ${\rm h}$  are the functions you have found in the first paragraph, what condition must the real numbers a,b and c satisfy in order that

$$y = ax + b + \frac{c}{x}$$

should be a solution of (\*)?

## Section B: Mechanics

**9** A particle is projected from a point *O* with speed  $\sqrt{2gh}$ , where *g* is the acceleration due to gravity. Show that it is impossible, whatever the angle of projection, for the particle to reach a point above the parabola

$$x^2 = 4h(h - y),$$

where x is the horizontal distance from O and y is the vertical distance above O. State briefly the simplifying assumptions which this solution requires.

**10** A small ball of mass m is suspended in equilibrium by a light elastic string of natural length l and modulus of elasticity  $\lambda$ . Show that the total length of the string in equilibrium is  $l(1+mg/\lambda)$ .

If the ball is now projected downwards from the equilibrium position with speed  $u_0$ , show that the speed v of the ball at distance x below the equilibrium position is given by

$$v^2 + \frac{\lambda}{lm}x^2 = u_0^2.$$

At distance *h*, where  $\lambda h^2 < lm u_0^2$ , below the equilibrium position is a horizontal surface on which the ball bounces with a coefficient of restitution *e*. Show that after one bounce the velocity  $u_1$  at x = 0 is given by

$$u_1^2 = e^2 u_0^2 + \frac{\lambda}{lm} h^2 (1 - e^2),$$

and that after the second bounce the velocity  $u_2$  at x = 0 is given by

$$u_2^2 = e^4 u_0^2 + \frac{\lambda}{lm} h^2 (1 - e^4).$$

**11** Two identical uniform cylinders, each of mass m, lie in contact with one another on a horizontal plane and a third identical cylinder rests symmetrically on them in such a way that the axes of the three cylinders are parallel. Assuming that all the surfaces in contact are equally rough, show that the minimum possible coefficient of friction is  $2 - \sqrt{3}$ .

## Section C: Probability and Statistics

- **12** A school has *n* pupils, of whom *r* play hocket, where  $n \ge r \ge 2$ . All *n* pupils are arranged in a row at random.
  - (i) What is the probability that there is a hockey player at each end of the row?
  - (ii) What is the probability that all the hockey players are standing together?
  - (iii) By considering the gaps between the non-hockey-players, find the probability that no two hockey players are standing together, distinguishing between cases when the probability is zero and when it is non-zero.
- **13** A scientist is checking a sequence of microscope slides for cancerous cells, marking each cancerous cell that she detects with a red dye. The number of cancerous cells on a slide is random and has a Poisson distribution with mean  $\mu$ . The probability that the scientist spots any one cancerous cell is p, and is independent of the probability that she spots any other one.
  - (i) Show that the number of cancerous cells which she marks on a single slide has a Poisson distribution of mean  $p\mu$ .
  - (ii) Show that the probability Q that the second cancerous cell which she marks is on the kth slide is given by

$$Q = e^{-\mu p(k-1)} \left\{ (1 + k\mu p)(1 - e^{-\mu p}) - \mu p \right\}.$$

- **14** (i) Find the maximum value of  $\sqrt{p(1-p)}$  as *p* varies between 0 and 1.
  - (ii) Suppose that a proportion p of the population is female. In order to estimate p we pick a sample of n people at random and find the proportion of them who are female. Find the value of n which ensures that the chance of our estimate of p being more than 0.01 in error is less than 1%.
  - (iii) Discuss how the required value of n would be affected if (a) p were the proportion of people in the population who are left-handed; (b) p were the proportion of people in the population who are millionaires.
